This chimeric phosphorothioate oligonucleotide, having 2'-MOB wings and a decoyy gap, is targeted to the coding region of human Toll-like receptor 4 mRNA. It exhibits 73% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, Toll-like receptor 4; receptor; antiinflammatory; immunomodulator; phosphorothioate; antisense; ss.
                                                                                                                                                                                                                                                                                                  New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Th1 or Th2 immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /mod_base= OTHER

The present sequence is that of antisense oligonucleotide ISIS #114632. This chimeric phosphorothioate oligonucleotide, having 2'-MOE wings and a decay gap, is targeted to the coding region of human Toll-like receptor 4 mRNA. It exhibits 72% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Th1 or Th2 immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; Toll-like receptor 4; receptor; antiinflammatory; immunomodulator; phosphorothioate; antisense; 88.
deoxynucleotides, flanked on both sites by 5-nucleotides wings composed of 2'-methoxyethyl nucleotides"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human Toll-like receptor 4 antisense oligonucleotide ISIS #114649.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is that of antisense oligonucleotide ISIS #114644. This chimeric phosphorothioate oligonucleotide, having 2'-MOE wings and a decoyy gap, is targeted to the coding region of human Toll-like receptor 4 mRNA. It exhibits 72% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Th1 or Th2 immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; Toll-like receptor 4; receptor; antiinflammatory; immunomodulator; phosphorothioate; antisense; 88.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is that of antisense oligonucleotide ISIS #114649. This chimeric phosphorothioate oligonucleotide, having 2'-MOE wings and a decoxy gap, is targeted to the 3' untranslated region of human Toll-like receptor 4 mRNA. It exhibits 91% inhibition of human Toll-like receptor 7 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Thl or Th2 immune
/note= "OTHER = phosphorothioate nucleotides, the oligonucleotide comprises a central gap region of 10 2'-deoxynucleotides, flanked on both sites by 5-nucleotides wings composed of 2'-methoxyethyl nucleotides"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

This chimeric phosphorothioate oligonucleotide, having 2'-MOE wings and a deoxy gap, is targeted to the start codon region of human Toll-like receptor 4 mRNA. It exhibits 48% inhibition of human Toll-like receptor 4 profile in the start of the start of the expression of Toll-like receptor 4. In cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Thl or Th2 immune
                                                                                                                                   /note= "OTHER = phosphorothioate nucleotides, the oligonucleotide comprises a central gap region of 10 2'-deoxynucleotides, flanked on both sites by 5-nucleotides wings composed of 2'-methoxyethyl nucleotides"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The present sequence is that of antisense oligonucleotide ISIS #114636. This chimeric phosphorothioate oligonucleotide, having 2'-MOE wings and a deoxy gap, is targeted to the coding region of human Toll-like receptor 4 mRNA. It exhibits 59% inhibition of human Toll-like receptor 4 expression in THP-1 cells. Such oligonucleotides are useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                     Human; Toll-like receptor 4; receptor; antiinflammatory; immunomodulator; phosphorothioate; antisense; ss.
                                                                                                                                                                                                                                                             /note= "OTHER = phosphorothioate nucleotides, the oligonucleotide comprises a central gap region of 10 2'-deoxynucleotides, flanked on both sites by 5-nucleotides wings composed of 2'-methoxyethyl nucleotides"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense oligonucleotides for modulating Toll-like receptor 4 ge expression, particularly useful for preventing, delaying or treating inflammatory disorders, or conditions involving Th1 or Th2 immune
                                                                                                         Human Toll-like receptor 4 antisense oligonucleotide ISIS #114636.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 20 BP; 8 A; 6 C; 3 G; 3 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                         ö
                       This chimeric phosphorothicate oligonucleotide, having 2-MOE wings and a deoxy gap, is targeted to the coding region of human Toll-like receptor 4 mRNA. It exhibites 38; inhibition of human Toll-like receptor 4 expression in THP-1 cells. More active oligonucleotides are useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                    Human; Toll-like receptor 4; receptor; antiinflammatory; immunomodulator; phosphorothioate; antisense; 88.

                                                                                                                                                                                                                                                                                                                                    The present sequence is that of antisense oligonucleotide ISIS #114640. This chimeric phosphorothicate oligonucleotide, having 2'-MOE wings and a decoyy ago, is targeted to the coding region of human Toll-like receptor 4 mRNA. It exhibits 87% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; Toll-like receptor 4; receptor; antiinflammatory; immunomodulator; phosphorothioate; antisense; ss.
                                                                                                                                                                                expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Th1 or Th2 immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /note= "OTHER = phosphorothioate nucleotides, the oligonucleotide comprises a central gap region of 10 2'-deoxynucleotides, flanked on both sites by 5-nucleotides wings composed of 2'-methoxyethyl nucleotides"

                                                                                                                                                                                                                                                                                                The present sequence is that of antisense oligonucleotide ISIS #114654. This chimeric phosphorothicate oligonucleotide, having 2'-MOE wings and a decay gap, is trargeted to the 3' untranslated region of human Toll-like receptor 4 mRNA. It exhibite 92' inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Th1 or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; Toll-like receptor 4; receptor; antiinflammatory; immunomodulator; phosphorothioate; antisense; 88.
                                                                                                                                                                                                                        New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Th1 or Th2 immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /note= "OTHER = phosphorothioate nucleotides, the oligonucleotide comprises a central gap region of 10 2'-deoxynucleotides, flanked on both sites by 5-nucleotides wings composed of 2'-methoxyethyl nucleotides"

The present sequence is that of antisense oligonucleotide ISIS #114641. This chimeric phosphorothioate oligonucleotide, having 2'-MOB wings and a deoxy gap, is targeted to the coding region of human Toll-like receptor 4 mRNA. It exhibits 83% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Thl or Th2 immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human Toll-like receptor 4 antisense oligonucleotide ISIS #114642.

Human Toll-like receptor 4 antisense oligonucleotide ISIS #114647

(first entry)

08-SEP-2003

ACC83591 standard; DNA; 20 BP.

```
The present sequence is that of antisense oligonuclectide ISIS #114642. This chimeric phosphorothicate oligonuclectide, having 2'-MOE wings and a decay gap, is targeted to the coding region of human Toll-like receptor 4 mRNA. It exhibites 76% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonuclectide is particularly useful for treating or preventing a disease or condition associated with Itall-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Th1 or Th2 immune
                                                                           /note= "OTHER = phosphorothioate nucleotides, the oligonucleotide comprises a central gap region of 10 2'-deoxynucleotides, flanked on both sites by 5-nucleotides wings composed of 2'-methoxyethyl nucleotides"

This chimeric phosphorothioate oligonucleotide, having 2'-MOB wings and a decoxy gap, is targeted to the coding region of human Toll-like receptor 4 mRNA. It exhibits 71% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Thl or Th2 immune
                                                                                                                                                                                                                          /note= "OTHER = phosphorothioate nucleotides, the oligonucleotide comprises a central aga region of 10 2'-deoxynucleotides, flanked on both sites by 5-nucleotides wings composed of 2'-methoxyethyl nucleotides"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ..

The present sequence is that of antisense oligonucleotide ISIS #114651. This chimeric phosphorothicate oligonucleotide, having 2'-MOE wings and a decay gap, is targeted to the 3' untranslated region of human Toll-like receptor 4 mRNA. It exhibits 91% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; Toll-like receptor 4; receptor; antiinflammatory; immunomodulator; phosphorothioate; antisense; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /note= "OTHER = phosphorothioate nucleotides, the oligonucleotide comprises a central gap region of 10 2'-deoxymucleotides, flanked on both sites by 5-nucleotides wings composed of 2'-methoxyethyl nucleotides"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e. inflammatory disorders, or conditions involving Th1 or Th2 immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human Toll-like receptor 4 antisense oligonucleotide ISIS #114651.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a novel nucleotide sequence and protein of a new hepatitis E virus HEV-T1 and the application of the nucleotide sequence and protein in diagnosing, preventing and treating hepatitis. The present sequence is a PCR primer described in the exemplification of the invention
        The present sequence is that of antisense oligonucleotide ISIS #114639. This chimeric phosphorothioate oligonucleotide, having 2'-MDE wings and a decoxy gap, is trargeted to the coding region of human Toll-like receptor 4 mRNA. It exhibits 0% inhibition of human Toll-like receptor 4 expression in THP-1 cells. Active oligonucleotides are useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The disonate is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response,
                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                  .;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Hepatitis E virus; HEV-T1; hepatitis infection; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered innate immunity. A variant TLR4 nucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, severity of sepsis, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, LPS (lippolypaccharide) induced chronic airway disease conditions such as systematic inflammatory disease conditions such as systematic inflammatory response syndrome (RNBS), and the respiratory distress syndrome (ARDS), and the respiratory distributions are respiratory distributions are respiratory distributions are respiratory distributions.
                                                                                                                                                                                       TLR4; toll receptor 4; innate immunity; gram-negative bacteria; sepsis; respiratory distress syndrome; LPS; lipopolysaccharide; asthma; ARDS; chronic airway disease; arthritis; inflammatory disease; SIRS; human; systematic inflammatory response syndrome; pyelonephritis; bronchitis; acute respiratory distress syndrome; gall bladder disease; pneumonia; cystic fibrosis; antibacterial; antiinflammatory; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          pyelonephritis, gall bladder disease, pneumonia, bronchitis, chronic obstructive pulmonary disease, local gram-negative bacterial infection and cystic fibrosis. Sequences AAC84776-823 represent PCR primers for amplifying the exons of human TLR4 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identifying humans at risk of, or having indication associated with altered innate immunity involves detecting or determining whether DNJ amplified from a biological sample encodes a portion of variant toll
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .;

```
A system for inhibiting the biological activity of myeloid differentiation factor 88 (MyD88), useful for treating vascular diseases (e.g. atherosclerosis), comprises an intravascular device and MyD88
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a system for inhibiting the biological activity of myeloid differentiation factor 88 (MyD88) which comprises an intravascular device and a therapeutic composition coated upon the intravascular device, the composition comprising a MyD88 inhibitor. The system or method is useful for treating vascular diseases including etherosclerosis, transplant atherosclerosis, vein-graft atherosclerosis, thrombosis, restenosis, stent restenosis or angioplasty restenosis, thrombosis, restenosis, stent restenosis suffering from angina pectoris, ischaemias, conditions associated with ischaemias including stroke.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              transient ischaemic attacks, heart attack, osteonecrosis, colitis, poor kidney function or congestive heart failure, poor blood circulation to the extremities and complications of poor blood circulation including slow wound healing, inflammation, infections and claudication. The present sequence represents a human Toll-like receptor 4 TLR-4 reverse transcriptase (RT)-PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 6; SEQ ID NO 4; 18pp; English.

This invention relates to a novel method for the treatment of a vascular disease through the administration of a Toll-like receptor-4 (TLR-4) inhibitor to a mammal. The TLR-4 protein has been linked to several disease such as atherosclerosis, restenosis, inflammation and other. Vascular diseases. Compounds which inhibit the activity of TLR-4, through the inhibition of its receptor, may have vasotropic, the inhibition of its receptor, may have vasotropic, antiatreficaclerotic, thrombollyric, cardiant and antiinflammatory activities. This may also be achieved through antisense therapy or gene therapy. The method or the system of the invention may therefore be conseful for inhibiting or treating a vascular disease, for example atherosclerosis, restenosis, tent restenosis, angioplasty restenosis, or inflammation and other heart disease. The present sequence is that of a constinct which was used for reverse transcription polymerses chain and also the present transcription polymerses chain and also the present sequence is that of a constinct that the activity of the constinct the present sequence is that of a constinct that the constinct the present sequence is that of a constinct that the constinct the constitution of the constitution and the constitution and constitution the constitution and constitution the constitution and constitution the constitution and co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                        The invention relates to modulating an immune response in an animal. The method of the invention comprises modulating colony stimulating factor-1 (CSF-1) activity in order to modulate the immune response of the animal. Also disclosed is a pharmaceutical composition comprising a modulator of CSF-1 activity and a pharmaceutical carrier. The method or the pharmaceutical composition is useful for the prophylactic or therapeutic treatment of bacterially-induced septic shock. The sequences given in records ACC74129-ACC74161 represent primers and probes used in an example from the invention to detect murine genes
                                                                                                                                                                                                                    Modulating an immune response in an animal, useful for the prophylactic or therapeutic treatment of bacterially-induced septic shock, by modulating colony stimulating factor-1 (CSF-1) activity in an animal.

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered inmunity. A variant TLR4 nucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, severity of sepsis, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, LPS (lipopolysaccharide) induced chronic airway disease, asthma, arthritis, local and systemic inflammatory disease conditions such as systematic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (ARDS), pyelonephritis, gall bladder disease, pneumonia, bronchitis, chronic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAV51401-V51704 are forward PCR primers used to amplify fragments of the Zea mays genome in order to detect polymorphic markers. Such markers can be used in the construction of allele-specific primers and probes for
     obstructive pulmonary disease, local gram-negative bacterial infection and cystic fibrosis. Sequences AAC84776-823 represent PCR primers for amplifying the exons of human TLR4 gene

This sequence represents an example of an antisense oligonucleotide of the invention. The oligonucleotides are 8-50 nucleotides in length, and are targeted to a nucleic acid encoding human B-raf and which is capable of inhibiting human B-raf expression. The oligonucleotides is used to inhibit the (abnormal) expression of human B-raf, to inhibit hyperproliferation of calls, to treat or prevent an abnormal proliferative condition, e.g. hyperproliferative disorders such as cancer (e.g. of the brain or nervous system), restenosis, psoriasis or a disorder characterised by T-cell activation and growth. They may also be used to diagnose these diseases, as well as atherosclerosis. The oligonucleotides of the invention may be used to distinguish rafeassociated tumours from tumours having other etiologies. The antisense oligonucleotides can also be used to quantify raf expression in assays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; raf; hyperproliferation; neovascularisation; ocular angiogenesis; therapy; cancer; cytostatic; anti-angiogenic; vascular; ophthalmological; antisense; phosphorothioate backbone; B-raf kinase; ss.
                New antisense oligonucleotides - for modulation of human B-raf gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human B-raf kinase antisense oligonucleotide ISIS #14142.
                                                                                                                                                                                                                                                                                                                                                 0.4%; Score 17; DB 1; Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                  an osteoclast precursor cell comprises contacting the cell with at least one TLR nor the osteoclast precursor cell. This ligand, where the TLR ligand stimulates at least one TLR on the osteoclast precursor cell. The invention may be useful for the development of compounds with an osteopathic activity or ifor gene therapy. The composition and methods are useful in inhibiting differentiation of an osteoclast precursor cell which may be used in the development of therapies to treat patients suffering from bone loss associated with bacterial infection and bone loss resulting from other diseases. These may also be used in identifying a Toll-like receptor that inhibits that of a mouse toll-like receptor (TLR) RT-PCR primer which was used in the exemplification of the invention.
                                                                                                                                                                                      This invention relates to a novel method of inhibiting differentiation of

                                                                      The present invention relates to novel antisense oligonucleotides which are targetted to nucleic acids encoding human raf proteins and capable of inhibiting raf expression. The invention also relates to methods of inhibiting hyperproliferation of cells which involves contacting the hyperproliferation of cells which involves contacting the hyperproliferation of the invention. The method is useful for treating cancer, angiogenesis or neovascularisation, especially ocular angiogenesis or neovascularisation. The present DNA sequence is an antisense oligonucleotide targetted to human B-raf kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Preventing and/or treating conditions associated with raf expression, such as hyperproliferative disorders, atherosclerosis and tumors, using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             tumour metastasis; human; raf; raf expression inhibitor; cytostatic; antiarteriosclerotic; antisense-therapy; hyperproliferative disorder; atherosclerosis; tumour; b-raf kinase; antisense oligonucleotide; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                which is targeted to mRNA encoding human c-raf, a-raf or b-raf (raf is a protein kinase playing a regulatory role in signal transduction, regulating cell proliferation and has been implicated in lung carcinoma), and which is capable of inhibiting raf expression. Also included is a composition comprising the oligonucleotide and a pharmaceutically acceptable carrier. The antisense oligonucleotide is useful for inhibiting the expression of human raf in human cells or tissues by contacting the human cells or tissues with the oligo. The oligo. is also is useful for treating or preventing a disease or condition associated
disclosed are raf oligonucleotides, nucleic acids, proteins and compositions used in the methods of the invention. The oligonucleotides have cytostatic and antiarteriosclerotic properties, are useful as Rafinhibitors and in antisense-therapy. The methods and compositions of the present invention are useful for preventing and/or treating conditions associated with raf expression, such as hyperproliferative disorders, atherosclerosis and tumours. This sequence represents a human b-raf
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel antisense oligonucleotide which is targeted to mRNA encoding human raf and which is capable of inhibiting raf expression, useful for treating or preventing hyperproliferative conditions such as cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an oligonucleotide 8-50 nucleotides in length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; ss; antisense; c-raf; a-raf; b-raf; protein kinase; cancer; signal transduction; cell proliferation; lung carcinoma; cytostatic; antisense gene therapy; chemotherapeutic agent; angiogenesis; hyperproliferative condition; neovascularisation; ocular angiogenesis.

method of the invention comprises modulating colony stimulating factor-I (CSP-1) activity in order to modulate the immune response of the animal. Also disclosed is a pharmaceutical composition comprising a modulator of CSF-1 activity and a pharmaceutical carrier. The method or the pharmaceutical carrier. The method or the pharmaceutical for the prophylactic or therapeutic readment of bacterially-induced septic shock. The sequences given in records ACC74129-ACC74161 represent primers and probes used in an example from the invention to detect murine genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to modulating an immune response in an animal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                    chemotherapeutic agent to a human or cells of the human, where the expression of raf is abnormal expression, and the condition is a hyperproliferative condition such as cancer, angiogenesis or neovascularisation (preferably ocular angiogenesis or neovascularisation). The oligo, is also useful for inhibiting hyperproliferation of cells. The oligos, are also useful as tools, for example for detecting and determing the role of raf expression in various cell functions and physiological processes and conditions and for diagnosing conditions associated with raf expression and for purposes. The present sequence is an antisense oligonucleotide targeting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PCR primers AAV37060-61 and AAV37062-63 are used to amplify antibiotic resistance gene aac6'-IIa. They are used in the course of the invention. The specification describes the use of probes and/or amplification primers which are specific, ubiquitous and sensitive for determining presence and amount of nucleic acids from a bacterial antibiotic resistance gene and specific bacterial and fungal species in any sample suspected of containing the bacterial or fungal nucleic acids, where each of the nucleic acid or variant or part comprises a selected target region bybridisable with the probes or primers. The method of use comprises contacting the sample with the probes or primers and detecting the presence of hybridised probes or amplified products as an indication of the presence of the specific bacterial or fungal species and bacterial antibiotic resistance genes. The methods and products can be used to detect and identify the bacterial and fungal species and genera and

The invention relates to a splice variant of human HJ06972 (KIRA1079), designated AF06972 (ADD93815), and nucleic acids encoding it (ADD93814). Gengared to the HJ06972 (DAD (ADD93812), AF06972 (DAD contains an additional 94 bp exon (ADD93816) between bases 4623-4624 of HJ06972 and its splice variant AF06972 are related to apoptosis-associated tyrosine kinase (AATYK), a protein which is involved in apoptosis and the liferentiation or proleiferation of nerve cells, and are likely to have similar activity. The invention also relates to vectors and host cells comprising AF06972 DNA sequences, the recombinant production of AF06972 polypeptides, antibodies specific for AF06972 in immunoassay method using the antibodies, a method for detecting apoptosis regulatory activity, a method for evaluating a compound for its ability to induce activity, a method for evaluating a compound for its ability to induce activity, a method for evaluating a compound for its ability to induce activity, and related compounds and methods of the invention may be used in the treatment of disorders associated with apoptosis, nerve cell growth and division, and hepatitis. Sequences ADD93830 nerve cell growth and division, and hepatitis. Sequences ADD93830 nerve

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5, or 3, end genomic flanking regions, 5 and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, case in antisense gene therapy. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition may have a cuse in antisense gene therapy. The composition may have a cuse in antisense gene therapy. The composition may have a cuse in antisense gene therapy. The composition may have a cuse in antisense gene therapy. The composition may have a cuse in a subject of the composition of depleting or for enhancing the prophylactic or therapeutic respiratory effect of an antisinflammatory steroid in a subject, for reducing or depleting levels of ... receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject is tissue, or treating bronchoconscription, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

WPI; 2003-093058/08.

S Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted trucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 2877; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonuclectides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonuclocities, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, oystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or reating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.

The invention comprises an antisense oligonucleotides that are targeted antisense acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antisense oligonucleotide; glucocorticoid receptor; infection; inflammation; tumour formation; diabetees; obesity; cardiovascular disorder; hyperlipidaemia; Cushing's syndrome; human; ss; phosphorothioate backbone; 2-methoxyethyl; 2'-MOE.

                                                                                                                                                                                                                                                                                The invention comprises an antisense oligonucleotides that are targeted to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                             New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polymorphism, human, inhibitor; cancer; treatment; cell growth; LOH; cell viability; loss of heterozygosity; precancerous condition; ASI; allele specific inhibitor; somatic cell; diagnosis; prevention; atherosclerotic plaque; premalignant metaplastic lesion; andometriosis; dysplastic lesion; benign tumnour; polycystic kidney disease; transplant; graft versus host disease; malignant cell removal; bone marrow; ss.

This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heteroxygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the precancerous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic form present in the concern and an allele of the precancerous conditions of the gene concern, at the diagnosis, premailignant metaplastic or dysplastic cancers, atherosclerotic plaques, premailignant metaplastic or dysplastic or dissing tumours, endometriosis, polycyclic kindry disease, and AAZ25812-Z26825 represent graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ25812-Z26825 rej human polymorphic sites described in the method of the invention

Primer intU2 for SSCP analysis of PMM2 exon 5A.

Phosphomannomutase-2; PMM2; CDG1; mutation; human; transgenic; assay; carbohydrate-deficient glycoprotein syndrome type 1; drug screening; Jaeken disease; single-strand confirmation polymorphism; SSCP; prenatal diagnosis; PCR primer; ss.

Matthijs G;

WPI; 1999-024063/02.

New DNA encoding human phosphomannomutase or its fragments - used to detect mutations associated with carbohydrate-deficient glycoprotein syndrome-1, particularly for prenatal diagnosis.

the coding region of the human helicase-moi gene. The antisense oligomucleotides of the invention are useful for inhibiting the spression of human helicase-moi in cells or tissues, and for treating a helicase-moi-associated condition. The antisense oligomucleotides of the invention may also be used to delay infection, inflammation and tumour

The invention comprises antisense oligonucleotides which are targeted

Claim 3; Col 43-44; 52pp; English.

Novel antisense compound for modulating expression of human helicase-moi and for treating inflammation, specifically hybridizes to a specific region in nucleic acid molecule encoding the human helicase-moi.

WPI; 2002-749291/81.

Claim 5; Page 64; 104pp; English.

the nucleotide sequence encoding the protein. The DNA or its fragments are used to detect mutation in the PMMZ genes that are associated with the carbohydrate-deficient glycoprotein syndrome type I (CDGI). The sequences can also be used to detect expression of PMMZ-related CDNA; to express PMMZ or its mutants; and to create transgenic animals for use in drug screening and for studying expression pathways. The expressed proteins are used to screen for agents that modulate activity of PMMZ, for therapy and to raise specific antibodies (for detecting PMMZ or its mutants, in competitive or capture assays). Biochemical assays for phophomannomutaes activity are used to identify possible carriers of CDGI (Jaeken disease). Measuring enzymatic activity in foetal cells (or in parental leucocytes if such cells are unavailable) and detecting mutations in the PMMZ gene makes possible a better prenatal diagnosis of CDGI. Sequences AAV80026-41 represent primers used in PCR and singlestand confirmation polymorphism (SSCP) analysis of the 8 exons of PMMZ gene. These primers are used to determine the SSCP mutations in the PMMZ ö invention relates to a human phosphomannomutase-2 (PMM2) protein and Gaps Human; antisense gene therapy; phosphorothioate backbone; antisense oligonucleotide; helicase-moi gene; inflammation; ss; helicase-moi-associated condition; infection; tumour formation; 2-MOE nucleotide; 2'-methoxyethyl nucleotide. ö 0.4%; Score 16.4; DB 1; Length 20; 94.4%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to antisense oligonucleotides, compositions and methods for modulating the expression of helicase-moi. The oligonucleotides are used in treating an animal having a disease or condition associated with helicase-moi, such as inflammation, a hyperproliferative disorder or a condition that arises from RNA-mediated
  formation. The present DNA sequence represents a human helicase-moi gene antisense oligonuclectide of the invention. NOTE: The present DNA sequence has a phosphorothioate backbone, bases 1-5 and 16-20 are 2'-methoxyethyl (2'-MOE) nucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ,

The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-NOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                  antisense oligonucleotide; glucocorticoid receptor; infection; inflammation; tumour formation; diabetes; obesity; tumour formation; thyperlipidaemia; Cushing's syndrome; human; ss; phosphorothioate backbone; 2 - methoxyethyl; 2'-MOE.
                                                                                                                                                                                                                                                                                                                                                                             #2460
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                             Human glucocorticoid receptor-specific antisense oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .;

New antisense oligonuclectides for modulating never in mitosis, gene a (NIMA)-related kinase 6 expression, useful for diagnosing, preventing or treating diseases associated with the kinase, e.g. hyperproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to antisense compounds targeted to a nucleic acid encoding human never in mitosis gene a-related kinase 6 (MIMA-related kinase 6). The antisense compound comprises an antisense oligomuclectide that specifically hybridises with the nucleic acid and inhibits the expression of NIMA-related kinase 6. The antisense oligomuclectide is a chimeric oligomuclectide. The antisense oligomuclectide comprises at least one modified internucleoside linkage, preferably a phosphorochioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl (2'-MOE) sugar moiety. The antisense oligomucleotide further comprises at least one modified nucleobase, preferably a 5-methylcycosine. The antisense oligomucleotide further comprises at least one modified nucleobase, preferably a 5-methylcycosine. The antisense oligomucleotide further comprises
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         hyperproliferative disorders, e.g. cancer. The present sequence represents a human NIMA-related kinase 6 DNA target sequence for an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0.4%; Score 16.4; DB 1; Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention comprises an antisense oligonucleotides that are targeted antisense acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
                                                                                                                                                                                                                               antisense oligonucleotide; glucocorticoid receptor; infection; inflammation; tumour formation; diabetees; obesity; cardiovascular disorder; hyperlipidaemia; Cushing's syndrome; human; ss; phosphorothioate backbone; 2 - methoxyethyl; 2 - MOE.
                                                                                                                                                                                Human glucocorticoid receptor-specific antisense oligonucleotide #4092.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antisense therapy; human; NIWA-related kinase 6;

The present invention relates to antisense compounds targeted to a nucleic acid encoding human never in mitosis gene a-related kinase 6 (NIMA-related kinase 6). The antisense compound comprises an antisense oligonuclectide that specifically hybridises with the nucleic acid and inhibits the expression of NIMA-related kinase 6. The antisense coligonuclectide is a chimeric oligonuclectide. The antisense oligonuclectide comprises at least one modified internucleoside linkage, preferably a phosphorothicate linkage. It also comprises at least one moditied sugar moderty, preferably a 2.0-methoxyethyl (2.-MOS) sugar moderty, preferably a 5.-methylcytosine. The antisense conjectide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense conjectide further comprises such as hyperproliferative disorders, e.g. cancer. The present sequence represents an antisense oligonucleotide used in the examples of the

this invention relates to a novel method for evaluating substances for their effectiveness in treating beca-cell hypofunction. Specifically, it refers to the beta cells of the pancreas islets that normally function to synthesise and secrete insulin in response to glucose in the blood. The present invention describes measuring the expression levels of at least one of eight specific genes in the presence of a test substance, to indicate its effectiveness in treating beta-cell hypofunction.
Accordingly, this method can be used in the treatment of diabetes, in particular type II diabetes (or non-insulin dependent diabetes, in wIDDM). This oligonuclectide is a murine PCR primer given in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polymerase chain reaction; PCR; primer; amplify; human; T cell receptor; beta chain; TCR; myelin basic protein; BP; autoantigen; encephalitogen; experimental autoimmune encephalomyelitis; BAR; multiple sclerosis; MS; autoimmune disease; neurological disease; cerebrospinal fluid; therapy; central nervous system; complementarity determining region; CDR; T lymphocyte; optical nerve damage; anterior chamber inflammation; ss.

encephalomyelitis (EAE), and is the leading candidate as an encephalicygen involved in multiple scalenosis. (MS). By detecting the presence of a marker TCR variable (W) gene bias in a body fluid which encapsulates all or a portion of the target organ, an autoimmune disease (such as a neurological disease) in a human can be identified. This method can also be carried out to detect the presence of a biased motification of the pathogenic antigen in a nontarget tissue or organ. By analysing the Wosta gene repertorie of crebrospinal fluid (CP), and determining the Wosta gene repertorie of crebrospinal fluid (CP), and determining the presence of a Wosta gene bias, an immune-related disease that targets the central nervous system can be disease or organ of the disease, and selection is carried out by identifying a Wosta gene bias in a body fluid that is not the target tissue or organ of the disease, and selecting an immunogenic peptide to the women entarity determining region 2 (CDR2) of a V gene peptide on the surface of a T lymphocyte in the CF of a patient and administering a peptide corresponding to the Wosta gene bias. Ms can be treated by identifying the surface of a T lymphocyte in the CF of a patient and administering a peptide corresponding to this region. These methods can also be used for the diagnosis and immune-related therapy of optical nerve damage and an analyse of a contractor chamber inflammation as well as other human neurological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                diseases

The invention relates to a method of detecting Kawasaki disease by detecting an increase in Vbeta6.5 or Vbeta6.5/Vbeta2.1 positive T-cells. The sequences AAA95531-A95626 represent primers and probes used to PCR amplify and detect the level of expression of Valpha and Vbeta genes in T

cells in Kawasaki disease

Assessing cardiovascular status in humans by polymorphic analysis - of genes for angiotensin converting enzyme, angiotensinogen and angiotensin II receptor, used to diagnose predisposition to disease and to predict effect of therapy.

Example 1; Page 32; 71pp; English.

```
This sequence represents a PCR primer for the human ACE (angiotensin converting enzyme) gene, and can be used in the method of the invention. The method is for assessing cardiovascular status in humans by determining the sequence of at least one polymorphic site in the ACE determining the sequence of at least one polymorphic site in the ACE angiotensin converting enzyme), AGT (angiotensinnogen) and/or ATI (type 1 angiotensin converting enzyme), AGT (angiotensinnogen) and/or ATI (type 1 angiotensin II receptor) genes, and comparing the polymorphic pattern with that in patients with predetermined markers of status. The method is used to assess blood pressure or electrocardiographic profile, to diagnose a cardiac condition such as (allent) myocardial infarction (MI), bypertension, atherosclerosis or stroke. They can also be used to predict antagonists, diuretics, alpha- or beta-adrenergic receptor antagonists, etc. It is also used to identify susceptibility to cardiovascular can income the genes are used to screen for cardiovascular agents. The nucleic acids contained in the library can be is used as source of probes

The invention relates to a novel method of assessing the cardiovascular status in an individual and to newly identified polymorphisms in the genes encoding angiotensin-converting enzyme (ACE), angiotensin II receptor type 2 (ATI), angiotensin II receptor type A and beta-adrenergic receptors 1 and 2. The method comprises determining the sequence at one or more polymorphisms from the individual with a reference polymorphic positions within these genes, and comparing the pattern of polymorphisms from the individual with a reference polymorphic pattern ob polymorphisms from the individual with a reference polymorphic pattern ob polymorphic may predict a popularity of a individual exhibiting a predetermined cardiovascular disease status. The polymorphic markers are useful for determining the predisposition of an individual to cardiovascular disease status of an individual to receive and stroke. They are also useful for predicting the likely cardiovascular status of aptient given a predicting the likely cardiovascular status of aptient given a treatment regimen comprising administration of cardiovascular drugs of the genes comprising administration of a treatment regimen. Fragments of the genes comprising a polymorphic site may be used as provides a basis for predicting the outcome of a treatment regimen. Fragments of the genes comprising a polymorphic site may be used as primars and probes for detecting genetic polymorphic pattern reduces or they encode are useful in the screening. The genes, and the proteins change. Determination of an individual's polymorphic pattern reduces or eliminate patients from clinical trials who are predicted to be nonceptual at a risk for an adverse response, to a particular response, or at a risk for an adverse response, to a particular

ö
identify polymorphic patterns so that the adverse results can be correlated with a sub-population of the test population, permitting exclusion of such sub-populations from the treatment group. Beneficial drugs can be approved for use in the appropriate population, thereby decreasing the number of patients required for a clinical trial, which in turn decreases the duration and cost of such trials. Sequences AAA3826-A38315 represent PCR primers used in an exemplification of the invention to amplify short fragments of the human angiotensin II receptor type I (AT1) gene regulatory region (AAA38331) for sequence determination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Assessing disease status in individual by determining sequence(s) at one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          or more polymorphic positions within the human genes encoding the protein(s) involved in physiological pathway associated with treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                         Human ACE, AGT and AT1 genes polymorphisms PCR primer SEQ ID NO: 108.

The present invention is related to methods for determining the polymorphic pattern of an individual and using the results to determine their risk of a number of diseases, including cancer, cardiovascular diseases, glaucoma and nervous system disorders such as depression and neurodegenerative diseases. In addition, the methods can be used to determine the effects of different types of treatment for individuals, and thus enables appropriate therapies to be prescribed. The PCR primers shown in sequences AAC61201-C61371 were all used to demonstrate the

The present sequence is one of a number of primers used in a method for detecting a mutation or a polymorphism in the human ATM gene, which is associated with the disease ataxia telangiectasia, or a polyexonic eukaryotic gene of at least 4 kb. The method uses an improved version of single-stranded conformation polymorphism (SSCP) electrophoresis that allows electrophoresis of two or three amplified segments in a single lane. The method is useful for screening large, complex polyexonic eukaryotic genes such as the ATM gene for mutations and polymorphisms. The new mutations and polymorphisms in the ATM gene are useful for performing more accurate screening of human DNA samples for mutations, for distinguishing mutations from polymorphisms, and for improving the efficiency of automated screening method: The meethod provides a screening method of genes for multiple polymorphisms and mutations at enemy points and cukaryotic genes, having mutations and polymorphisms at many points and not merely at one or a few hot spote. Note: the SEQ ID assigned to this sequence in the disclosure and claims of the the specification is one

```

```
The present invention provides the protein and coding sequences of human dipeptide aminopeptidase 28. The sequences can be used in the treatment of cancer, nosobaemia, HIV infection, immunological diseases and inflammation. The present sequence is a coding sequence fragment
                                                                                                                                                                                                                                                        /partial
/note= "the sequence contains no start or stop codon"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             nervous system; Thce gene; CofE protein; tubulin-specific chaperone;

This interaction describes a novel isolated nuclear acid used in a rest of system. The nucleic acid is a mutant form of the murine Thee gene which encodes the Octs protein, a tubulin-specific chaperone essential for complexation of alpha- and beta-tubulins. The mutant gene has a T to G alteration at position 1682, resulting in Gly rather than Trp at C- terminal position 1682, resulting in Gly rather than Trp at C- terminal position 1682, resulting in Gly rather than Trp at C- contexted with the identified diagnostic agent and binding determined, contexted with the identified diagnostic agent and binding determined, qualitatively or (semi) quantitatively. The mutant Thee gene may be diagnosed by in vitro hybridisation to mutation-specific probes or by contexted with test compound and either the survival rate or the contexted with test compound and either the survival rate or the formation of embryonal tubulin isoforms, class III beta-tubulin, ordered tubulin aggregates, microtubuli and/or axons determined and optionally compared with results of controls and/or of cells treated with as compound. Compounds are selected if they increase cell survival or reference compound. Compounds are selected if they increase cell survival or or modify formation of tubulin and/or axons. The novel mutation was identified in punypmn mice by typing a 31 cM region of chromosome 13. The products of the invention have neuroprotective, nootropic and antiparkinsonian activity and can be used and its derived peptide to identify agents for diagnosis of degenerative nerve diseases and nerve diseases but mutation and multiple sclerosis. These or is made are also useful in diagnosing and treating the disorders. This sequence represents an inverse PCR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   and treating the disorders. This sequence represents an inverse PCR primer used to amplify murine pmn candidate region sequence tagged sites (STS) found in YAC and BAC clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DB 1; Length 21;

The present invention describes a short interfering nucleic acid (siNA)

Example 3; SEQ ID NO 11; 139pp; English

New short interfering nucleic acid, useful e.g. for treatment and diagnosis of obesity or diabetes, downregulates expression of the stearoyl-CoA desaturase gene.

that downregulates expression of the SCD (stearcy1-CoA desaturase) gene by RNA interference. Also described: (1) modulating expression of SCD genes in cells, tissue explants or organisms by introduction of SCD kits for in vitro or in vivo delivery of SiNA; (3) conjugates and/or complexes of SiNA; and (4) vectors that express siNA. SCD inhibiting siNAs have anorectic, antidiabetic, antiarteriosclerotic, cytostatic and virucide activities. The SiNAs can be used to modulate expression of SCD genes, in cells, tissue explants or organisms, e.g. for treating obseity; diabetes (types I and II); atherosclerosis; cancer and viral infections. They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents an SCD SiNA, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0.4%; Score 16; DB 1; Length 19; 87.5%; Pred. The present invention describes a short interfering nucleic acid (siNA) that downregulates expression of the SCD (stearoyl-CoA desaturase) gene by RNA interference. Also described: (1) modulating expression of SCD genes in cells, tissue explants or organisms by introduction of siNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) vectors that express siNA; SCD inhibiting siNAs have anorectic, antidiabetic, antiatteriosclerotic, cytostatic and virucide activities. The siNAs can be used to modulate expression of SCD genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes (types I and II); atherosclerosis; cancer and viral infections. They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents an SCD siNA, which is used in the exemplification of the present invention.
                                                                       short interfering nucleic acid; siNA; downregulation; inhibition; SCD; stearoyl-CoA dematurame; RNA interference; anorectic; antidiabetic; antiatreliosclerotic; cytostatic; virucide; obesity; diabetes; atherosclerosis; cancer; viral infection; drug screening; genetic engineering; pharmacogenomic; gene mapping; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New short interfering nucleic acid, useful e.g. for treatment and diagnosis of obesity or diabetes, downregulates expression of the stearoyl-CoA desaturase gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

PCR primers (AAT61331 and AAT77158-86) were designed for amplification of the human Batten disease CLN3 gene (see also AAT61306) exons 1-15. The CRC primers for exon 4 are given in AAT77163 and AAT77164. Novel mutations (see also AAT61332-88) have been discovered in the CLN3 gene of Bd patients using a combination of PCR, single strand conformation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Batten disease polypeptide - useful to correct absence of wild type polypeptide, or as agonist to enhance activity of wild type polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          se; antisense; casein kinase2-beta; mouse; antisense gene therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a compound that is 8 - 50 nucleobases in length targeted to a nucleic acid molecule encoding Casein kinase 2-beta, and which specifically hybridises with and inhibits the expression of Casein kinase 2-beta, or which specifically hybridises with an 8-nucleobase portion of an active site on a nucleic acid molecule encoding Casein kinase 2-beta. Also included are: (1) a composition comprising the compound, and a carrier or diluent; (2) inhibiting the expression of casein kinase 2-beta in cells or tissues by contacting the expression of is inhibited, and (3) treating an animal having a disease or condition associated with Casein kinase 2-beta by administering to the animal the new compound so that the expression of Casein kinase 2-beta and for treating diseases or conditions associated with casein kinase 2-beta by administering the expression of Casein kinase 2-beta is inhibited. The antisense compounds are useful for modulating the expression of Casein kinase 2-beta is inhibited. The artisense compounds are useful for modulating the expression of Casein kinase 2-beta is inhibited. Whyerproliferative disorders, particularly cancer, such as breast cancer, prostate cancer, or liver cancer. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kinds of various manner of various members of kits, and in distinguishing petween functions of various members of is a particus members of a particus members of propertices.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                               New antisense oligonucleotides targeted to nucleic acid encoding Casein kinase 2-beta, useful in diagnostic and research applications, or for treating a disease or condition associated with the expression of Casein kinase 2-beta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ical pathway. The present sequence is an antisense oligonucleotide invention targeting mouse casein kinase 2-beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

solation of various biallele-specific oligonuclectide primers used in the isolation of various biallelic polymorphic markers found in the human genome (represented in AAX10269-X12937). These primers can be used in a method for determining polymorphic forms in an individual for used in e.g. of sagammaglobulinemia, diabetes insiplidus, Lesch-Nyhan syndrome, nuscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial opposterolemia, polycystic kidney disease, hareditary herencoytosis, von Willebrand's disease, tubercous sclerosis, hereditary haemorrhagic telangiectesia, familial colonic polyposis, Ehlers-Danios syndrome, osteogenesis imperfecta, acute intermittent porphyria, syndrome, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed, condust or therapeutic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, PCR, primer, vulnerary, anti-tumour, antirheumatic, antiarthritic, antiarteriosclerotic, cytostatic, neointima, scar, plaque, blood vessel; Toll-like receptor 4; adventitial cell; Tlr-4; ss.

The invention relates to a novel process for increasing the metabolites of carotene content of a plant. The novel process comprises upregulating at least one gene which encodes carotene hydroxylase activity. The compositions of the novel process have lycopene beta-cyclase or a beta-carotene hydroxylase activity. The process is useful for increasing the metabolites of carotene content of a plant, comprising transforming a plant cell from which viable plants may be recovered, using a plant expression cassette, or a DNA construct, and generating viable plants from the cell. The carotene metabolites are useful for increasing zeaxanthin and beta-carotene, including oxygenated carotenoids. This polymucleotide sequence represents an RT-PCR primer used in the process for the expression of the introduced proteins and endogenous carotenoid genes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        human; 88; SiRNA; short interfering nucleic acid; siNA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method for interfering with the formation of a neointima/scar and/or a plaque in a blood vessel by providing a ligand capable of modulating Toll-like receptor activity of adventitial cells. The method is useful for reducing the formation of a neointima/scar and/or a plaque in a blood vessel after stenting, angioplasty, heart transplantation, by pass surgery, arteriovenous shunting and infection, especially bacterial infection. The method is also useful for modulating tumour growth, and for modulating the effects of rheumatoid architis. The present sequence is a PCR primer for human
                                                                                                                                                                                                                                                                                                                                                                              Interfering with the formation of a neointima/scar and/or a plaque in a blood vessel, useful for modulating tumor growth, comprises providing a ligand capable of modulating Toll-like receptor activity of adventitial cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

(RIBO-) RIBOZYME PHARM INC.

This invention relates to novel short interfering nucleic acid (siNA)

molecules that downregulate expression of a protein tyrosine phosphataseIB (PTP-1B) gene by RNA interference (RNAi). Specifically, the siNAs can
be short interfering RNA interference (RNAi). Specifically, the siNAs can
cof PTP-1B. The present invention describes sequence-specific posttrancriptional gene silencing in animals using siNA molecules and
antisense oligonucleotides to modulate PTP-1B gene expression or
crivity. Furthermore, these siNA molecules provide useful reagents for a
crivity of therapeutic and diagnostic purposes, and as such can be used
for treating obseity, insulin resistance or diabetes (types I and II), as
well as for drug screening, target identification and validation, genetic
engineering, pharmacogenomics and for studying gene function and gene
mapping (for example of single-nucleotide polymorphisms). Accordingly,
these molecules exhibit anorectic and antidiabetic activities. ö sequence is an antisense siNA molecule that targets human human; 88; siRNA; short interfering nucleic acid; siNA; protein tyrosine phosphatase-1B; PTP-1B; RNA interference; RNAi; micro-RNA; miRNA; short hairpin RNA; shRNA; gene silencing; antisense; obesity; insulin resistance; diabetes; anorectic; antidiabetic. Gaps New short interfering nucleic acid, useful e.g. for treatment and diagnosis of obesity, downregulates expression of a protein tyrosine phosphatase-18 gene. This invention relates to novel short interfering nucleic acid (siNA)
molecules that downregulate expression of a protein tyrosine phosphatase-
18 (PTP-1B) gene by RNA interference (RNAi). Specifically, the siNAs can
be short interfering RNA (siRNA), double-stranded RNA (dsRNA), micro-RNA
(miRNA) or short hairpin RNA (shRNA), all of which can mediate inhibition
c f PTP-1B. The present invention describes sequence-specific post-
trancriptional gene silencing in animals using siNA molecules and
antisense oligonucleotides to modulate PTP-1B gene expression or
activity. Furthermore, these siNA molecules provide useful reagents for a
variety of therapeutic and diagnostic purposes, and as such can be used
for treating obesity, insulin resistance or diabetes (types I and II), as
well as for drug screening, target identification and validation, genetic
mapping (for example of single-nucleotide polymorphisms). Accordingly,
these molecules exhibit anorectic and antidiabetic activities. This
oligonucleotide sequence is a sense siNA molecule that targets human PTP-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shrNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; tumour necrosis factor; TNR; human; DNA-RNA hybrid; ss, antibacterial; immunosuppressive; antirheumatic; antiarthritic; anti-HIV; antipsoriatic; antinflammatory; septic shock; rheumatoid arthritis; HIV/AIDS; psoriasis; inflammation; autoimmune disease; target sequence.
New short interfering nucleic acid, useful e.g. for treatment and diagnosis of obesity, downregulates expression of a protein tyrosine phosphatase-1B gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human tumour necrosis factor (TNF) gene by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and autisense regions, or alternatively are assembled from a sense coligonucleotide short interfering RNA (siRNA), double-stranded RNA, micro-RNA include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically synthesised, expressed from a vector or enzymatically chemically synthesised. The invention also relates to kits for the in vitro or in control of siNA, conjugates and/or complexes of siNA, and vectors that express siNA. The siNAs are used to modulate expression of the TNF gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. The TNF siNAs have antibacterial, immunosuppressive, antiarthritis, antiarthritic, anti-HIV, antipsoriatic and autoimmune diseases. The siNAs are also useful for drug screening, diagnosis, theumatoid arthritis, HIV/AIDS, psoriasis, inflammation and autoimmune diseases. The siNAs are also useful for drug screening, dance also useful for drug screening, dance also useful for drug screening, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisme). The present sequence represents the mine and autoimmune control of a human TNF-targeted double-stranded sinA, which is
                                                                                                                                                                              New short interfering nucleic acid, useful e.g. for treatment and diagnosis of septic shock or rheumatoid arthritis, downregulates expression of the tumor necrosis factor gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          identical to the TNF transcript target sequence
                                                                                                                                                                                                                                                                                    Example 3; SEQ ID NO 66; 141pp; English

The invention relates to short interfering nucrous since in the invention relates to short interference. The sinks may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense and configuration of the sinks of sense and antisense oligonucleotide. Specifically, the sinks include short interfering RNA (siRNA). The sinks can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically contain an also relates to kits for the in vitro or in vivo delivery of sink, conjugates and/or complexes of sink, and vectors that express sink. The sinks are used to modulate expression of the TNF gene in cells, tissue explants or organisms (e.g., by ex vivo gene to conditions. The TNF sinks are used to modulate expressive, antirheumatic, antiarthritic, anti-HIV, antipsoriatic and anticheumatic antiarthritis, They may be used for treating septic shock, theumatoid arthritis, HUVAIDS, psoriasis, inflammation and autoimmune diseases. The sinks are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic entire treating septic of the therapeutic target identification and validation, genetic entire.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human TNF-targeted double-stranded siNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                         New short interfering nucleic acid, useful e.g. for treatment and diagnosis of septic shock or rheumatoid arthritis, downregulates expression of the tumor necrosis factor gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to short interfering nucleic acids (siNA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

artery cytostatic; anticonvulant; notropic; muscula, anti-HIV; what interference; iRNA; antisense technology; lipid metabolism; cholesterol imbalance; dyslipidaemia hypercholesterolaemia; coronary attery disease; CAD; coronary heart disease; CHD; atherosclerosis; hepatic glucose production; glucose-metabolism-related disorder; disbates; cancer; breast cancer; colon cancer; lung cancer; neurological disease; Huntington disease; spinocerebellar ataxia; viral disease; AIDS; apolipoprotein B; apoB; ss. antilipemic; cardiant; vasotropic; antiarteriosclerotic; antidiabetic; Interference RNA agent useful for treating dyslipidemias, coronary disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications. Example 5; SEQ ID NO 3026; 378pp; English. 2003US-0465665P 2003US-0465802P 2003US-0493986P 2003US-0494597P 2003US-0506341P 2003US-0510246P 2003US-0455050P. 2003US-0462894P. 2003US-0463772P. 2003US-0454265P. 2003US-0454962P. 2003US-0510318P. 2003US-0518453P. 08-MAR-2004; 2004WO-US007070 Bumcrot D; (ALNY-) ALNYLAM PHARM.

The invention describes a RNA interference (iRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2-O alkyl modifications, the antisense sequence and the antisense sequence asymmetrical phosphorothicate modifications and the antisense sequence targets a human gene sequence. Also described and the antisense sequence targets a human gene sequence. Also described care: a pharmaceutical preparation comprising (I); reducing (II); involves selecting a sequence with activity and stabilising (I), involves selecting a sequence with activity and consortivity; a kit comprising (I) and instruction for its use; and a device the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.

Cueseful for reducing apoB-100 levels or glucose-6-phosphatase levels.

Cuevals of cholesterol, and/or disregulation of lipid metabolism. The disorder is choses for coronary artery disease (CHD), coronary heart cype-companial publication and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism.

Cueseful disorder e.g. diabetes or type-2 diabetes. (I) is useful for relating the diseases as mentioned above, cancer (e.g. breast) or coronary artery disease (c.g., Hung cancer), neurological

ö Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications. The invention describes a RNA interference (iRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2'-O alkyl modifications, the antisense sequences have one or more asymmetrical phosphorothicate modifications antilipemic; cardiant; vasotropic; antiarteriosclerotic; antidiabetic; cytostatic; anticonvulsant; nootropic; muscula; anti-HIV; MAX interference; iRNA; antisense technology; lipid metabolism; cholesterol imbalance; dyslipidaemia hypercholesterolaemia; coronary artery disease; CAD; coronary heart disease; CHD; atherosclerosis; hepatic glucose production; glucose-metabolism-related disorder; diabetes; cancer; breast cancer; colon cancer; lung cancer; neurological disease; Huntingron disease; spinocerebellar ataxia; viral disease; AIDS; apolipoprotein B; apoB; ss. are: a pharmaceutical preparation comprising (II); reducing (MI) apoB-100 levels or glucose-6-phosphatase levels in a subject; producing (II); stabilising (II); involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. The subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of apoB-100, elevated or otherwise unwanted expression of apoB-100, elevated or otherwise unwanted characterised by elevated or otherwise unwanted expression of apoB-100, clevated or otherwise unwanted characterised by elevated or otherwise unwanted expression of apoB-100, clevated or otherwise unwanted characterised by closesterolaemia, and/or disregulation of lipid metabolism. The dispense from the HDL/LDL cholesterol imbalance, dyslipidaemias, hypercholesterorolaemia, statin-resistant clisease (CHD) and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism. Creating the diseases as mentioned above, cancer (e.g. breast, colon or lung cancer), neurological disease (e.g., Huntington disease or lung cancer), neurological disease (e.g., Huntington disease or lung cancer elected librated or elected elect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        spinocerebellar ataxia) or viral disease (e.g., AIDS). disorders, inflammatory processes, certain genetic disorders, cancers, etc. . The present sequence represents an oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                               The specification describes oligodeoxyribonucleotides having contiguous nucleoside subunits joined by intersubunit linkages, where at least 3 contiguous subunits are joined by phosphoramidate intersubunits. The coligodeoxyribonucleotides has a sequence of mucleoside subunits effective to form a duplex with a target nucleic acid molecule. The oligodeoxyribonucleotides are more resistant to nuclease digestion and have improved RNA and dsDNA hybridisation characteristics, relative to oligonucleotides not containing N3'-P5' phosphoramidate linkages. They also have excellent antisense activity against complementary mRNA targets in .vitro cell growth inhibition assays. They also exhibit low cytcoxicity. They may be used in diagnostic and therapeutic applications, e.g., in combatting infections agents such as bacteria, viruses, etc. or in treatment of smooth muscle cell proliferation
                                Oligo:nucleotide N3'-P5' phosphoramidate(s) - have improved resistance toward phosphodiesterase digestion, and form stable duplexes with DNA and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isolated nucleic acid encoding hepatocyte nuclear factor 1-alpha and beta - useful for detecting susceptibility for non-insulin dependent diabetes, especially maturity-onset diabetes of the young.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hepatocyte nuclear factor 1 beta; HNF-1 beta; MODY4; human; transcription factor; maturity onset diabetes of the young; TCF2; diabetes; NIDDM; diagnosis; therapy; DCOH; PCBD; PCR; primer; ss.

                This is a reverse PCR primer designed for use with a forward primer (see AAV52212) in the PCR amplification of exon 4 of the human DCOM (PCBD) gene. The bifunctional DCOM/PCBD protein stabilises dimers of hepatocyte nuclear factor-1 beta (HNF-1 beta, see AAW71581) with itself or with HNF-1 alpha (see AAW71559). Mutations of HNF are associated with MODY (maturity onset diabetes of the young) type diabetes. No diabetes-sesociated mutations were found in DCOH
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New oligo:nucleotide(s) that modulate expression of B7 proteins - used for, e.g. controlling activation and proliferation of T cells, particularly for treatment, diagnosis and prevention of inflammation.
                                                                                                                                                                                                                                                                                                                                                         1. .5

AAZ3741, AAZ37472, AAZ37739, AAZ37740 and AAZ37741 are used in the exemplification of the present invention. The present invention describes novel nucleotide antisense compounds, targetted to the 5' untranslated, translation termination codon, or 3' untranslated region of a nucleic acid encoding human mdm2, that modulates expression of human mdm2. The oligonucleotides mediate their effect by antisense inhibition of hyperproliferative gene expression. The antisense compound is used to treat an animal having a disease or condition associated with mdm2, especially of the blood, brain, breast, lung or soft tissue, or psoriasis, fibrosis, atherosclerosis or restenosis
The oligonucleotides which specifically hybridise to B7 modulate its expression (and thus T cell activation and proliferation). This is particularly useful for treatment and prevention of inflammation and autoimmune diseases, e.g. asthma, (juvenile) diabetes, myasthenia gravis, Grave's disease, rheumatoid arthritis, allograft rejection, psoriasis, (systemic) lupus erythematosus, multiple sclerosis, contact dermaticis, rhintis, allergy, cancer and metastases. The oligonucleotides may also be used to manipulate T cell activation ex vivo; to determine or detect B7 protein expression; for diagnosis; as assay and purification reagents, and to study physiological roles of B7 proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense compounds used to treat eg. hyperproliferative conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human mdm2 gene; proliferation; tumour; phosphorothioate; p53; cancer; antisense; modulation; oligonucleotide; expression; hihlbition; hyperproliferation; blood cancer; brain cancer; brain cancer; brain cancer; lung cancer; soft tissue cancer; psoriasis; fibrosis; atherosclerosis;

                            This sequence represents a PCR primer used in the method of the invention. The method is for detecting the presence of alleles for invention. The method is for detecting the presence of alleles for glaucoma comprising haplotype analysis of human chromosome 2 and 6 respectively, where the haplotypes are associated with loci (GCIB and GLC6p25 respectively. The primers are used to amplify gene sequences to generate information necessary to compile haplotype profiles can be used to localise, isolate and symptomatic glaucoma. They can also be used to localise, isolate and identify the CGLC1B and GLC6p25 loci so that detection of individuals with glaucoma is enhanced. The haplotype analyses also provide means for identification and following of mutant alleles in pedigrees or populations. Cidentification of presymptomatic individuals using the methods allows intervention in the disease process and obviates the impact of inheriting a metant allele causing disease, by medically disrupting the initiation

The oligonuclectides are useful for modulating the expression of human TNFalpha in cells and tissues, reducing a human cell inflammatory response, reducing the blood glucose level in a human and treating a human having a disease or condition associated with TNFalpha. Examples of diseases associated with TNFalpha include diabetes, inflammatory bowel
This sequence represents an antisense oligonucleotide sequence which targets a region of the human tumour necrosis factor alpha (TNFalpha) uncleotide sequence. The Alpha is an important cytckine that plays a role in host defence. It is produced mainly in macrophages and monocytes in response to infection, invasion, injury or inflammation. Overexpression of TNFalpha can result in disease states, particularly in infectious, inflammatory and autoimmune diseases. The invention relates to antisense oligonucleotides, such as that represented by the present sequence which are capable of modulating the TNFalpha gene expression. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       infectious disease, hepatitis, atopic dermatitis or allograft rejection.
The antisense oligonucleotides are also useful for modulating the

Novel antisense compound 8-30 nucleobases in length targeted to a nucleic acid molecule encoding human mdm-2 useful for modulating the expression of human mdm-2 and reducing hyperproliferation of human cells.
                                                                                                                                                                                                                                                                            The present invention relates to an antisense compound 8-30 nucleobases in length targeted to nucleobases 1-308 of the 5' untranslated region, 1776-1806 of the translation termination codon region or 1818-2370 of the 3' untranslated region of a nucleic acid molecule encoding human mdm-2. The invention is useful for reducing hyperproliferation of human cells, modulating the expression of mdm2 in human cells or tissues or in vitro. The hyperproliferative disorder includes cancer or psoriasis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /noce = "OTHER= All phosphorothioate linkages, additionally bases 1-6 and bases 15-20 are 2'-0-methoxyethyl bases, and bases 7-14 are deoxynucleotides"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, mdm2; hyperproliferative disorder; cancer; psoriasis; atherosclerosis; tumour; cytostatic; anti psoriatic; anti arteriosclerotic; vasotropic; antisense; phosphorothioate; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention provides sequences of antisense oligonucleotides targeted at the murine and human B7-1 and B7-2 coding and mRNA sequences. The antisense sequences have phosphorothicate backbones and some nucleotides are 2'-methoxyethoxy residues. The sequences can be used in the treatment of inflammatory and autoimmune disorders, including asthma, juvenile diabetes mellitus, myasthenia gravis, Graves' disease, rheumatoid arthritis, allograft rejection, inflammatory bowel disease, multiple sclerosis, psoriasis, systemic lupus erythematosus, contact dermatitis, rhinitis, allergies and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .

length targeted to the 5 untranslated region, translation termination codon region, 3' untranslated region, coding region or translation start site of a nucleic acid encoding human mada, where the antisense compound modulates the expression of human mada. They may be used for treating an animal having a disease or condition associated with amplification of mada encoding overexpression of human mada. They may be used for treating an animal having a disease or condition associated with amplification of mada gene or overexpression of mada e.g. a hyperproliferative disorder such as cancer (blood, brain, breast, lung, or a soft tissue cancer) and psoriasis, fibrosis, atherosclerosis or restenosis, tumours, colorectal carcinoma and chronic myelogenous leukemia. The antisense compound may be administered with a chemotherapeutic agent to overcome drug resistance.
An antisense compound, useful for treating e.g. cancer, comprises nucleobases targeted a region (e.g. translation termination codon region) of a nucleic acid encoding human mdm2.
                                                                                                                                                                                                                                                                                                                                                      present invention relates to antisense compounds, 8-30 nucleobases in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The antisense compound reduces hyperproliferation of human cells. The method, which involves the use of the antisense compound, is also useful for detecting the role of mdm2 expression in various cell functions and physiological processes and useful in both clinical research and diagnostic tools. AAS29242-AAS29507 represent the human mdm2 antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 20 BP; 0 A; 4 C; 4 G; 12 T; 0 U; 0 Other;

ö
                 Novel antisense compound targeted to nucleic acid encoding Fas, Fas ligand or Fas associated protein-1 is useful for inhibiting expression of Fas, Fas ligand, or Fap-1 in cells or tissues, and for treating
                                                                                                                                                                            This invention relates to an antisense compound encoding Fas, Fas ligand, or Fas associated protein-1 (Fap-1). The inhibition of Fas mediated signalling is thought to be immunosuppressive, antiinflammatory, hepatotropic, cytostatic and vasotropic. Antisense oligonucleotides were designed to target human Fas. Oligonucleotides were synthesised as chimeric oligonucleotides and are useful for treating an animal having an autoimmune or inflammatory disease e.g., hepatitis, cancer, a condition associated with apoptosis, allograft rejection, or ischemia reperfusion injury. Optionally, the above mentioned conditions are prevented by contacting the allograft with the antisense oligonucleotide. The
                                                                                                                                                                                                                                                                                                                                                                                                         oligonucleotides are used in diagnostics, therapeutics, prophylaxis and as research reagents and in kits. The oligonucleotides are also useful for research purposes. The present nucleotide sequence is related to human Fas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Treating inflammatory disorders such as inflammatory bowel disease, Crohn's disease or rheumatoid arthritis, in a subject, by administering

sequence

```
The invention comprises antisense oligonucleotides which are targeted to the human mdm2 gene. The antisense oligonucleotides of the invention are useful for reducing hyperproliferation of human cells. The antisense oligonucleotides are also useful for treating: hyperproliferative disorders (e.g. cancer), psoriasis, fibrosis, atheroselerosis, or restenosis. The antisense oligonucleotides are also useful for modulating

ö The invention describes a method of treating an inflammatory disorder in an individual, comprising administering to the individual an oligonucleotide upto 30 nucleotides in length complementary to a nucleic acid molecule encoding human tumor necrosis factor (TMP)-alpha. The method is useful for treating an inflammatory disorder such as inflammatory bowel disease, Crohn's disease, colitis or rheumatoid arthritis, in an individual. The method is also useful for treating diabetes, pancreatitis, multiple sclerosis, atopic dermatitis, asthma, and hepatitis in an individual. This sequence represents an antisense oligonucleotide which inhibits expression of human tumor necrosis factor Novel antisense compound targeted to 5' untranslated region, coding region, or intron:exon junction of nucleic acid molecule encoding mdm2, useful for treating e.g. cancer, psoriasis or restenosis by inhibiting oligonucleotide used to modulate expression of tumour necrosis factor Gaps Chiang MY; ô antisense oligonucleotide; human; mdm2; hyperproliferation; hyperproliferative disorder; cancer; psoriasis; fibrosis; atherosclerosis; restenosis; apoptosis modulation; p21; ss; 2'-methoxyethoxy-residue; phosphorothioate backbone. apoptosis, and for increasing expression of p21. The present DNA sequency represents a human mdm2 gene antisense oligonucleotide of the invention. The present sequence contains 2'-methoxyethoxy-residues and has a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               disorder in an individual by topically applying an antisense compound targeted to a nucleic acid molecule encoding a human B7 protein. The invention is for treating an inflammatory skin disorder in individual. The skin disorder is psoriasis, contact dermatitis, atopic dermatitis, seborrheic dermatitis, nummular dermatitis, generalised exfoliative dermatitis or eczema. The invention effectively modulates critical costinulatory molecules such as the B7 protein. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Treating an inflammatory skin disorder such as psoriasis comprises topically applying an antisense compound targeted to the nucleic acid encoding human B7 protein.
                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Pharmaceutical composition for treating ailments associated with impaired or respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid

Claim 15; SEQ ID NO 1200; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation coodon, coding regalon, 5' or 3' end ganomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entilnflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallargic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of condition, and of, or reducing sensitivity to adenosine, reducing levels of using surfactant in a subject or treating bronchoconstriction, lung surfactant in a subject or a respiratory disease or condition. Note: The sequence date for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5 or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubjquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of, or reducing sensitivity to adenosine, reducing levels of adenosine or processing producing producing producing increasing levels of uniquinone or processive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                lung surfactant in a subject's tissue, or treating bronchoconstriction, ung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; antisense; lung dysfunction; nasal airway dysfunction; antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Katz E, Pabalan J, Aguilar D;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure; SEQ ID NO 13086; 872pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human eotaxin oligonucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Li Y, Sandrasagra A, Ka

reference gene expression profile indicative of toxicity, and so determining the presence of a toxic response to the agent. Also determining the presence of a toxic response to the agent. Also determining the presence of a toxic response to the agent. Also from the genes corresponding to the partial sequences given in AB282842 to AB284764, or their fragments of at least 20 nucleotides, or homologues of and (2) determining if a gene putatively identified to be a toxic response gene plays a role on toxic response pathways by determining the expression profile of the gene after exposure of cells or a human subject to a known toxic pharmaceutical or industrial agent, comprising; (a) exposing cells to an agent or isolating cells from a human subject who was exposed to an agent or isolating the test gene expression profile for a putatively identified toxic response gene after exposure to a known coxic pharmaceutical or industrial agent; and (c) comparing the test profile to the expression profile of a gene with a similar function or comparing the test profile to the expression profile of a gene with a similar function or profile to the test profile to the expression profile of a gene with a similar function or profile to the expression profile of a gene with a similar function or comparing the test profile to the expression profile of a gene with a similar function or predicting and determining toxicological responses on a cellular, organ or system level. The arrays comprising the human genes are useful for toxicological screening of drugs, pharmaceutical compounds and chemicals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Determining a toxicological response to an agent, useful for screening of drugs, comprises comparing the expression profile of one or more human toxic response genes to a reference gene expression profile indicative of

```
The present invention describes a DNA molecule derived from a prokaryotic cell, where at least one of the DNA regions encoding NNB (where N = asparagine, X = any amino acid other than proline, and B = serine or threonine) has been modified so that no N-glycosylation occurs during the expression in a eukaryotic cell. Also described: (1) a fused DNA molecule, where a DNA encoding a signal sequence has been ligated to the N-terminal end of the modified DNA molecule as described above so that it may be expressed as a fusion protein; (2) a recombinant virus integrated with the DNA molecule or the fused DNA molecule described above; (3) producing a modified or fusion protein by using the recombinant virus described above, to express a protein encoded by the modified DNA molecule or the fused DNA molecule in a eukaryotic cell; and (4) a vaccine comprising the recombinant virus. The DNA molecule has virucide a vaccine for treating viral infections. The DNA molecule is useful for producing a vaccine for treating viral infections. The present sequence is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DNA molecule derived from a prokaryotic cell, useful for producing a vaccine for treating viral infections comprises at least one modified DNA regions encoding NXB so that no N-glycosylation occurs during expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DNA molecule, prokaryotic cell; eukaryotic cell, virucide, vaccine, immunostimulant, viral infection; PCR primer; linker; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to novel isolated retroelement comprising at least 90% identity to a 14028 base pair sequence (S1), given in the specification or to nucleotides 1-1747, 12220-13864, 1-385, 1-40, 1708-1747, 1893-3575, 3576-4555, 4602-6314, 6315-7655, 8745-10600, 8745-10673 or 8745-10728 of this sequence, or its complement. The nucleic acid may be useful in detecting infections, such as those caused by retroviruses. This sequence corresponds to a retroelement associated sequence.
                                                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acids related to retrovirus elements from
Arabidopsis thaliana, useful for detecting infections, such as those
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mkNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthem, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleorides into products that free adenosine into the system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ung, brain, heart, kidney, etc, tissue environment and thereby, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The
                                                                                                                                                                                                                                                                                                        t
                                                                                                                                                                                                                                                                          Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted truncleic acids associated with lung airway or lung dysfunction, and
                                                                                                                                                         Katz E, Pabalan J, Aguilar D;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 20 BP; 1 A; 6 C; 1 G; 12 T; 0 U; 0 Other;

ដ Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted trucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 14162; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The coligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung expression of a target polypeptide associated with lung airway or lung cyptention also describes a kit, that comprises: (a) a delivery device, in separate containers (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallargic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to composition and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated inflammation, allergies and/or surfactant hypoproduction are associated inflammation. inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of oligonucleotides into products that free adenosine into the system

e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

Claim 15; SEQ ID NO 1200; 763pp; English

inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, thilammation, allergies answer as pulmonary vasoconstriction, allergies asthma, impeded respiration, respiration, distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrensful agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypethide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung invention describes a novel composition (a) a first active agent,

```
This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, configonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antialflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a conference respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. pulmonary obstruction, and/or bronchoconstriction and/or lung

```
with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distresses syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; se; primer.
                       inflammation, allergies and/or surfactant hypoproduction are associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and

dysfunction or cancer and can be anti-sense to the corresponding arrays of the invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immosuppressive and cytosteric activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises of oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or reduce the amount of target polypeptide present in the lungs. The reduce the amount of target polypeptide present in the lungs. The composition, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic thintis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary corresponding to the included adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligon pulmonary interpression, emphysema.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, VbetaRNA or cDNA. The kit is useful for diagnosing organ transplant respection and diagnosing and treating T-cell associated diseases.

The including autoimmune disease, hypersensitivity diseases, infectious diseases and neoplastic disease. Autoimmune diseases include Addison's disease.

The propriety of allowing and treative nervous system diseases include multiple actrophic gastritis. Degenerative nervous system diseases include multiple actrophic gastritis as contact with allergement in the sort as contact with allergement in the goodpasture's syndrome and Type IV hypersensitivities such as those caused by viruses such as those present in leprosy. Infectious diseases include viral infections caused by viruses such as HIV, fungal infections such as those caused by schildrand parterial infections such as those caused by childrand bacterial infections such as those caused by situation and bacterial infections such as those caused by such as leukaemias, lymphomas and cancers such as caused by hyperal and bacterial infections such as those caused by such as leukaemias, lymphomas and cancers such as caused by contact of the brain, contact of the b

The invention relates to novel compounds of 8-80 nucleobases in length targeted to, and which specifically hybridises with, a nucleic acid molecule encoding 3-hydroxy-3-methylglutaryl-Consyme A (HMG-COA) reductase, and inhibits the expression of HMG-COA reductase. The novel compounds have cardiant, antiarteriosclerotic, and antilipaemic activities. The compound can be used to treat disorders by antisense gene therapy. The compounds, compositions and methods are useful for treating a disease or condition associated with HMG-COA reductase, such as a cardiovascular disorder e.g. atherosclerosis, or a disease or condition
                                                                                                                                         HMG-CoA reductase; 3-hydroxy-3-methylglutaryl-Coenzyme A;
